## Abstract

The aim of the project is to design and develop scripts for performing the collaborative tasks included in the instructional program of the courses under study. The courses follow a problem based and case analysis methodology.

These scripts may refer to different aspects of the organization and development of group activities, such as:

- phases of development of the activity;
- instructions regarding the tasks and subtasks in each phase;
- the group composition and organization in each task or phase;
- the possible distribution of information, materials and resources among participants;
- relations and interactions between groups, and with the lecturer;
- the process of reflection and evaluation of the activity by the participants;
- the timing of the different phases and of the whole activity.

We consider the possibility of incorporating some of these scripts into online resources for teaching support, such as certain moodle tools, which have already been used by the research team in previous projects, as well as in their teaching activities (for instance "tasks", "consultations", etc.).

This aim implies:

1. To identify the activities for which scripts will be designed, in order to design and adjust the scripts for the different courses.
2. To incorporate the scripts into the specific technological tools, be it totally or just in part, if necessary.
3. To implement the scripts for the actual development of the courses.
4. To evaluate the group work processes and results, both regarding the participants' point of view (lecturers' and students') and students' satisfaction.
